</IfModule>

# Since we're sending far-future expires, we don't need ETags for
# static content.
# developer.yahoo.com/performance/rules.html#etags
FileETag None

# ---------------------------------------------------------------------
# Stop screen flicker in IE on CSS rollovers
# ---------------------------------------------------------------------

# The following directives stop screen flicker in IE on CSS rollovers - in
# combination with the "ExpiresByType" rules for images (see above).

# BrowserMatch "MSIE" brokenvary=1
# BrowserMatch "Mozilla/4.\[0-9]\(2\)" brokenvary=1
# BrowserMatch "Opera" !brokenvary
# SetEnvIf brokenvary 1 force-no-vary

# ---------------------------------------------------------------------
# Set Keep-Alive Header
# ---------------------------------------------------------------------
Keep-Alive allows the server to send multiple requests through one TCP-connection. Be aware of possible disadvantages of this setting. Turn on if you serve a lot of static content.

IfModule mod_headers.c
   Header set Connection Keep-Alive
</IfModule>

Cookie setting from iframes

Allow cookies to be set from iframes (for IE only)
If needed, specify a path or regex in the Location directive.

IfModule mod_headers.c
   Header set P3P "policyref="/w3c/p3p.xml", CP="IDC DSP COR ADM DEVi TAIi PSA PSD IVAi"
</IfModule>

Start rewrite engine

Turning on the rewrite engine is necessary for the following rules and features. FollowSymLinks must be enabled for this to work.

Some cloud hosting services require RewriteBase to be set: goo.gl/HOcPM
If using the h5bp in a subdirectory, use `RewriteBase /foo` instead where `foo` is your directory.

If your web host doesn't allow the FollowSymLinks option, you may need to comment it out and use `Options +SymLinks0fOwnerMatch`, but be aware of the performance impact: http://goo.gl/M1uzd

IfModule mod_rewrite.c
   Options +FollowSymLinks
# Options +SymLinks0fOwnerMatch
   RewriteEngine On
# RewriteBase /
</IfModule>
# Suppress or force the "www." at the beginning of URLs
# The same content should never be available under two different URLs -
# especially not with and without "www." at the beginning, since this can cause
# SEO problems (duplicate content). That's why you should choose one of the
# alternatives and redirect the other one.

# By default option 1 (no "www.") is activated.
# no-www.org/faq.php?q=class_b

# If you'd prefer to use option 2, just comment out all option 1 lines
# and uncomment option 2.

# IMPORTANT: NEVER USE BOTH RULES AT THE SAME TIME!

# Option 1:
# Rewrite "www.example.com -> example.com".

<IfModule mod_rewrite.c>
    RewriteCond %{HTTPS} !on
    RewriteCond %{HTTP_HOST} ^www\.(.+)$ [NC]
    RewriteRule ^ http://\1%{REQUEST_URI} [R=301,L]
</IfModule>

# Option 2:
# Rewrite "example.com -> www.example.com".
# Be aware that the following rule might not be a good idea if you use "real"
# subdomains for certain parts of your website.

# <IfModule mod_rewrite.c>
#    RewriteCond %{HTTPS} !on
#    RewriteCond %{HTTP_HOST} !^www\..+$ [NC]
#    RewriteRule ^ http://www.%{HTTP_HOST}%{REQUEST_URI} [R=301,L]
# </IfModule>
# Built-In filename-based cache busting

# If you're not using the build script to manage your filename version revving,
# you might want to consider enabling this, which will route requests for
# /css/style.20110203.css to /css/style.css

# To understand why this is important and a better idea than all.css?v1231,
# read: github.com/h5bp/html5-boilerplate/wiki/cachebusting

# <IfModule mod_rewrite.c>
#  RewriteCond %{REQUEST_FILENAME} !-f
#  RewriteCond %{REQUEST_FILENAME} !-d
#  RewriteRule ^(.+)\.\(d+\)\.\(js|css|png|jpg|gif\)$ $1.$3 [L]
# </IfModule>

# Prevent SSL cert warnings

# Rewrite secure requests properly to prevent SSL cert warnings, e.g. prevent
# https://www.example.com when your cert only allows https://secure.example.com

# <IfModule mod_rewrite.c>
#  RewriteCond %{SERVER_PORT} !^443
#  RewriteRule ^https://example-domain-please-change-me.com%{REQUEST_URI} [R=301,L]
# </IfModule>

# Prevent 404 errors for non-existing redirected folders

# without -MultiViews, Apache will give a 404 for a rewrite if a folder of the
# same name does not exist.
# webmasterworld.com/apache/3006792.htm

Options -MultiViews
# custom 404 page
# ----------------------------------------------------------

# You can add custom pages to handle 500 or 403 pretty easily, if you like.
# If you are hosting your site in subdirectory, adjust this accordingly
#   e.g. ErrorDocument 404 /subdir/404.html
ErrorDocument 404 /404.html

# ----------------------------------------------------------
# UTF-8 encoding
# ----------------------------------------------------------

# Use UTF-8 encoding for anything served text/plain or text/html
AddDefaultCharset utf-8

# Force UTF-8 for a number of file formats
AddCharset utf-8 .atom .css .js .json .rss .vtt .xml

# ----------------------------------------------------------
# A little more security
# ----------------------------------------------------------

# To avoid displaying the exact version number of Apache being used, add the
# following to httpd.conf (it will not work in .htaccess):
# ServerTokens Prod

# "-Indexes" will have Apache block users from browsing folders without a
# default document Usually you should leave this activated, because you
# shouldn't allow everybody to surf through every folder on your server (which
# includes rather private places like CMS system folders).
<IfModule mod_autoindex.c>
    Options -Indexes
</IfModule>

# Block access to "hidden" directories or files whose names begin with a
# period. This includes directories used by version control systems such as
# Subversion or Git.
<IfModule mod_rewrite.c>
    RewriteCond %{SCRIPT_FILENAME} -d [OR]
    RewriteCond %{SCRIPT_FILENAME} -f
    RewriteRule "(^\.|.)$" - [F]
</IfModule>
</FileMatch>
