

```
# Apache configuration for b2evolution's base folder
# Lines starting with # are comments.
# Updated 2013-07-16

# PHP / SECURITY:
<IfModule mod_php5.c>
    # On some overly "secured" systems, the following may need to be added in each folder:
    # AddHandler application/x-httpd-php5 .php

    # The following will try to configure PHP in the way b2evolution would like it to be:
    php_flag register_globals Off
    # You may want to turn the following to Off on production servers
    # Please do this only if you know what you're doing and will be able to retrieve
    potential errors from your error log
    php_flag display_errors On
    # The following is the same as 'E_ALL & ~ E_STRICT' (except those constants may not be
    available here)
    php_value error_reporting 30719

    # You may also need some of the following:
    # Increase memory limit
    # php_value memory_limit 256M
</IfModule>

# DISABLE LISTING FILES ON SERVER:
# Don't show directory contents (not desirable, especially for media folders)
Options -Indexes
# Note: if you have access to the command line of your server, it would probably
# be even better to type this: a2dismod autoindex
# (This disables the directory listing module completely)

# DEFAULT DOCUMENT TO DISPLAY:
# In case no specific file is requested, we want to fall back to index.php
# In case some subdirectories are accessed, we want to display index.html
<IfModule mod_dir.c>
    DirectoryIndex index.php index.html
</IfModule>

# CLEAN URLS:
# The following will ensure you can pass extra params after the filename on the URL
<IfModule mod_rewrite.c>
```

```
AcceptPathInfo On
```

```
# CATCH EVERYTHING INTO B2EVD: (even if no php file appears in the URL)  
# The following will allow you to have a blog running right off the site root,  
# using index.php as a stub but not showing it in the URLs.  
# This will add support for URLs like: http://example.com/2006/08/29/post-title  
<IfModule mod_rewrite.c>  
    RewriteEngine On  
  
    # This line may be needed or not.  
    # enabling this would prevent running in a subdir like /blog/index.php  
    # RewriteBase /  
  
    # Redirect any .htm .html or no-extension-file that's not an existing file or directory  
to index.php:  
    RewriteCond %{REQUEST_FILENAME} !-d  
    RewriteCond %{REQUEST_FILENAME} !-f  
    RewriteRule ^([^.]+)(\.(html|htm))?$ index.php [L]  
</IfModule>
```
