

```
# This folder should never be publicly accessible. Its contents should ever ONLY  
# be requested through PHP includes or requires. The functions *.php aren't  
# really "bad" to be accessible publicly as everything is encapsulated in  
# funtions; however, swiftmailer is not and comes with test files and such  
# that could do something nasty if swiftmailer commited something malicious.  
# I know, extremely unlikely, but my paranoia gets the best of me.
