

DirectoryIndex index.txt

```
# Just to be clear this code should never be placed on webroot. this is specifically  
useful for sections like uploads folder where we only want static content to be present  
# also it is to be ensured that if we have any specific extension in such folders that  
needs to be added in the list below. example php55  
# this does inverse of allow_only_static as this basically assign all executable's to cgi-  
script and then disables CGI Execution in a way stopping execution of any file at server  
side.  
## Ref : http://journalxtra.com/websiteadvice/wordpress-security-hardening-htaccess-rules/  
## secure directory by disabling script execution  
AddHandler cgi-script .php .pl .py .jsp .asp .htm .html .shtml .sh .cgi .*
```

```
Options -ExecCGI
```
