#
```

RewriteEngine on

```
#  
# If the server's connecting port isn't secure (https), then  
# redirect request to same location but such that the communication  
# is secure. NOTE: this isn't as secure as turning off the unsecure  
# port because any confidential information in the request is exposed  
# in the unsuspecting request on the unsecure port. Shouldn't really  
# be a problem since the secure content should only contain secure  
# references and the likelihood that a client mucks with the url into  
# a reference to secure content is pretty darn small.  
#
```
