

RewriteEngine On

Check if this is the noredirect query string

RewriteCond %{QUERY_STRING} (^|&)noredirect=true(&| \$)

Set a cookie, and skip the next rule

RewriteRule ^ - [CO=mredir: 0: %{HTTP_HOST}], S[]

Check if this looks like a mobile device

(You could add another [OR] to the second one and add in what you

had to check, but I believe most mobile devices should send at

least one of these headers)

RewriteCond %{HTTP: x-wap-profile} !^\$ [OR]

RewriteCond %{HTTP: Profile} !^\$

Check if we're not already on the mobile site

RewriteCond %{HTTP_HOST} !^m\.

Check to make sure we haven't set the cookie before

RewriteCond %{HTTP: Cookie} !\smredir=0(;| \$)

Now redirect to the mobile site

RewriteRule ^ http://m.edablogs.com%{REQUEST_URI} [R,L]
