

```

# Sample Nginx rules configuration:
# amember rules (replace /amember to actual amember Pro path from site root)
#
#     location ~* ^/amember/. *\. (js|ico|gif|jpg|png|css|swf|csv)$ {}
#     location ~* ^/amember/setup/index.php$ { try_files not-existing-file @php; }
#     location ~* ^/amember/js.php { try_files not-existing-file @php; }
#     location ~* ^/amember/index.php$ { try_files not-existing-file @php; }
#     location ~* ^/amember/public.php$ { try_files not-existing-file @php; }
#
#     location ~* ^/amember/public { rewrite ^.*$ /amember/public.php; }
#     location ~* ^/amember/setup { rewrite ^.*$ /amember/setup/index.php; }
#     location ~* ^/amember { rewrite ^.*$ /amember/index.php; }
#
# you must already have something like that in your nginx configuration:
#
#     location ~ \.php$ {
#         try_files not-existing-file @php;
#     }
#     location @php {
#         fastcgi_pass 127.0.0.1:9000;
#         include fastcgi_params;
#     }
#
# it is necessary to have @php section, as it is referred by amember rules, and
# it must be located at bottom
#
#
<IfModule mod_rewrite.c>
    RewriteEngine on
# You may need to uncomment the following line if rewrite fails to work
# RewriteBase must be setup to base URL of your amember installation without
# domain name
    RewriteBase /amember
    RewriteRule ^public public.php [L]
    RewriteRule ^js.php js.php [L]
    RewriteRule !\.(js|ico|gif|jpg|png|css|swf|csv|html)$ index.php
</IfModule>

<IfModule mod_php5.c>
# php_flag magic_quotes_gpc off
</IfModule>

```
