

```
# If you are running PHP in CGI mode you will need to add one set of these
# directives to your .htaccess file, or your virtualhost configuration.
#
# The easiest way to do so is to simply rename this file ".htaccess"

# Option 1, mod_rewrite (req)
RewriteEngine on
RewriteCond %{HTTP: Authorization} !^$
RewriteCond %{QUERY_STRING} openid.mode=authorize
RewriteCond %{QUERY_STRING} !auth=
RewriteCond %{REQUEST_METHOD} =GET
RewriteRule (.*) %{REQUEST_URI}?%{QUERY_STRING}&auth=%{HTTP: Authorization} [L]

# Option 2, mod_rewrite (env)
#RewriteEngine on
#RewriteRule \.php$ - [E=PHP_AUTH_DIGEST:%{HTTP: Authorization},L]

# Option 3, mod_setenvif
#SetEnvIf Authorization "(.*)" PHP_AUTH_DIGEST=$1
```
