AddType application/javascript    js

# Manifest files

# If you are providing a web application manifest file (see the
# specification: http://w3c.github.io/manifest/), it is recommended
# that you serve it with the `application/manifest+json` media type.
#
# Because the web application manifest file doesn't have its own
# unique file extension, you can set its media type either by matching:
#
# 1) the exact location of the file (this can be done using a directive
# such as <Location>, but it will NOT work in the .htaccess file,
# so you will have to do it in the main server configuration file or
# inside of a <VirtualHost> container)
#
# e.g.:
#

```

```
# <Location "/.well-known/manifest.json">
#     AddType application/manifest+json          json
# </Location>
#
# 2) the filename (this can be problematic as you will need to ensure
# that you don't have any other file with the same name as the one
# you gave to your web application manifest file)
#
# e.g.:
#
# <Files "manifest.json">
#     AddType application/manifest+json          json
# </Files>
```

```
AddType application/x-web-app-manifest+json    webapp
AddType text/cache-manifest                     appcache manifest
```

Video

```
AddType video/mp4                             f4v f4p m4v mp4
AddType video/ogg                              ogv

# #####  
# # SECURITY #  
# #####
```

```
# -----  
# | Clickjacking |  
# -----
```

```
# Protect website against clickjacking.
```

```
# The example below sends the `X-Frame-Options` response header with the value  
# `DENY`, informing browsers not to display the web page content in any frame.
```

```
# This might not be the best setting for everyone. You should read about the  
# other two possible values for `X-Frame-Options`: `SAMEORIGIN` & `ALLOW-FROM`.  
# http://tools.ietf.org/html/rfc7034#section-2.1
```

```
# Keep in mind that while you could send the `X-Frame-Options` header for all  
# of your site's pages, this has the potential downside that it forbids even  
# non-malicious framing of your content (e.g.: when users visit your site using  
# a Google Image Search results page).
```

```
# Nonetheless, you should ensure that you send the `X-Frame-Options` header for  
# all pages that allow a user to make a state changing operation (e.g: pages  
# that contain one-click purchase links, checkout or bank-transfer confirmation  
# pages, pages that make permanent configuration changes, etc.).
```

```
# Sending the `X-Frame-Options` header can also protect your website against  
# more than just clickjacking attacks: https://cure53.de/xfo-clickjacking.pdf.
```

```
# http://tools.ietf.org/html/rfc7034

# -----
# | Reflected Cross-Site Scripting (XSS) attacks |
# -----

# (1) Try to re-enable the Cross-Site Scripting (XSS) filter built into the
#     most recent web browsers.
#
#     The filter is usually enabled by default, but in some cases it may be
#     disabled by the user. However, in Internet Explorer for example, it can
#     be re-enabled just by sending the `X-XSS-Protection` header with the
#     value of `1`.
#
# (2) Prevent web browsers from rendering the web page if a potential reflected
#     (a.k. a non-persistent) XSS attack is detected by the filter.
#
#     By default, if the filter is enabled and browsers detect a reflected
#     XSS attack, they will attempt to block the attack by making the smallest
#     possible modifications to the returned web page.
#
#     Unfortunately, in some browsers (e.g.: Internet Explorer), this default
#     behavior may allow the XSS filter to be exploited, thereby, it's better
#     to tell browsers to prevent the rendering of the page altogether, instead
#     of attempting to modify it.
#
#     http://hackademix.net/2009/11/21/ies-xss-filter-creates-xss-vulnerabilities
#
# IMPORTANT: Do not rely on the XSS filter to prevent XSS attacks! Ensure that
# you are taking all possible measures to prevent XSS attacks, the most obvious
# being: validating and sanitizing your site's inputs.
#
