<IfModule mod_mime.c>

    # Data interchange

    AddType application/json                json map topojson
    AddType application/ld+json            jsonld
    AddType application/vnd.geo+json       geojson
    AddType application/xml                atom rdf rss xml

    # JavaScript

    # Normalize to standard type.
    # https://tools.ietf.org/html/rfc4329#section-7.2

    AddType application/javascript         js

    # Manifest files

    # If you are providing a web application manifest file (see
    # the specification: https://w3c.github.io/manifest/), it is
    # recommended that you serve it with the `application/manifest+json`
    # media type.
    #
    # Because the web application manifest file doesn't have its
    # own unique file extension, you can set its media type either
    # by matching:
    #
    # 1) the exact location of the file (this can be done using a
    #    directive such as ``, but it will NOT work in
    #    the `.htaccess` file, so you will have to do it in the main
    #    server configuration file or inside of a ``
    #    container)
    #
    #    e.g.:
    #
    #        <Location "/.well-known/manifest.json">
    #            AddType application/manifest+json          json
```

```
#     </Location>
#
# 2) the filename (this can be problematic as you will need to
#     ensure that you don't have any other file with the same name
#     as the one you gave to your web application manifest file)
#
#     e. g. :
#
#     <Files "manifest.json">
#         AddType application/manifest+json          .json
#     </Files>
```

```
AddType application/x-web-app-manifest+json      webapp
AddType text/cache-manifest                       appcache manifest
```

Media files

```
AddType audio/mp4                               f4a f4b m4a
AddType audio/ogg                                oga ogg opus
AddType image/bmp                                 bmp
AddType image/webp                                webp
AddType video/mp4                                 f4v f4p m4v mp4
AddType video/ogg                                 ogv
AddType video/webm                                webm

```

```
# Serving `.ico` image files with a different media type
# prevents Internet Explorer from displaying them as images:
# https://github.com/h5bp/html5-
```

boilerplate/commit/37b5fec090d00f38de64b591bcddcb205aadf8ee

```
AddType image/x-icon                             cur ico
```

Web fonts

```
AddType application/font-woff                    woff
AddType application/font-woff2                    woff2
AddType application/vnd.ms-fontobject             eot
```

Browsers usually ignore the font media types and simply sniff

```
# the bytes to figure out the font type.
# https://mimesniff.spec.whatwg.org/#matching-a-font-type-pattern
#
# However, Blink and WebKit based browsers will show a warning
# in the console if the following font types are served with any
# other media types.
```

```
AddType application/x-font-ttf          ttc ttf
AddType font/opentype                   otf
```

```
# Other
```

```
AddType application/octet-stream       safariextz
AddType application/x-bb-appworld       bbaw
AddType application/x-chrome-extension  crx
AddType application/x-opera-extension   oex
AddType application/x-xpinstall         xpi
AddType text/vcard                      vcard vcf
AddType text/vnd.rim.location.xloc      xloc
AddType text/vtt                        vtt
AddType text/x-component                htc
```

```
</IfModule>

# </IfModule>

# #####
# # SECURITY #
# #####

# -----
# | Clickjacking |
# -----

# Protect website against clickjacking.
#
# The example below sends the `X-Frame-Options` response header with
# the value `DENY`, informing browsers not to display the content of
# the web page in any frame.
#
# This might not be the best setting for everyone. You should read
# about the other two possible values the `X-Frame-Options` header
# field can have: `SAMEORIGIN` and `ALLOW-FROM`.
# https://tools.ietf.org/html/rfc7034#section-2.1.
#
# Keep in mind that while you could send the `X-Frame-Options` header
# for all of your website's pages, this has the potential downside that
# it forbids even non-malicious framing of your content (e.g.: when
# users visit your website using a Google Image Search results page).
#
# Nonetheless, you should ensure that you send the `X-Frame-Options`
# header for all pages that allow a user to make a state changing
# operation (e.g: pages that contain one-click purchase links, checkout
# or bank-transfer confirmation pages, pages that make permanent
# configuration changes, etc.).
#
# Sending the `X-Frame-Options` header can also protect your website
# against more than just clickjacking attacks:
```

```
# https://cure53.de/xfo-clickjacking.pdf.  
#  
# https://tools.ietf.org/html/rfc7034  
# http://blogs.msdn.com/b/ieinternals/archive/2010/03/30/combating-clickjacking-with-x-frame-options.aspx  
# https://www.owasp.org/index.php/Clickjacking
```

```
# <IfModule mod_headers.c>  
#     Header set X-Frame-Options "DENY"  
#     # `mod_headers` cannot match based on the content-type, however,  
#     # the `X-Frame-Options` response header should be send only for  
#     # HTML documents and not for the other resources.  
#     <FilesMatch "\.

# | Content Security Policy (CSP) |  
# -----
```

```
# Mitigate the risk of cross-site scripting and other content-injection  
# attacks.  
#  
# This can be done by setting a `Content Security Policy` which  
# whitelists trusted sources of content for your website.  
#  
# The example header below allows ONLY scripts that are loaded from the  
# current website's origin (no inline scripts, no CDN, etc). That almost  
# certainly won't work as-is for your website!  
#  
# For more details on how to craft a reasonable policy for your website,  
# read: http://www.html5rocks.com/en/tutorials/security/content-security-policy/  
# (or the specification: http://www.w3.org/TR/CSP11/). Also, to make  
# things easier, you can use an online CSP header generator such as:  
# http://cspisawesome.com/.
```

```

# -----
# | Reflected Cross-Site Scripting (XSS) attacks |
# -----

# (1) Try to re-enable the cross-site scripting (XSS) filter built
# into most web browsers.
#
# The filter is usually enabled by default, but in some cases it
# may be disabled by the user. However, in Internet Explorer for
# example, it can be re-enabled just by sending the
# `X-XSS-Protection` header with the value of `1`.
#
# (2) Prevent web browsers from rendering the web page if a potential
# reflected (a.k.a non-persistent) XSS attack is detected by the
# filter.
#
# By default, if the filter is enabled and browsers detect a
# reflected XSS attack, they will attempt to block the attack
# by making the smallest possible modifications to the returned
# web page.
#
# Unfortunately, in some browsers (e.g.: Internet Explorer),
# this default behavior may allow the XSS filter to be exploited,
# thereby, it's better to inform browsers to prevent the rendering
# of the page altogether, instead of attempting to modify it.
#
# http://hackademix.net/2009/11/21/ies-xss-filter-creates-xss-vulnerabilities
#
# (!) Do not rely on the XSS filter to prevent XSS attacks! Ensure that
# you are taking all possible measures to prevent XSS attacks, the
# most obvious being: validating and sanitizing your website's inputs.
```
