# MiniEngine .htaccess
# (based on HTML5 Boilerplate + Drupal + Symfony 2)
#

# Custom URL rewriting
<IfModule mod_rewrite.c>

Options +FollowSymlinks
RewriteEngine On

# Determine the RewriteBase automatically and set it as environment variable.
# If you are using Apache aliases to do mass virtual hosting or installed the
# project in a subdirectory, the base path will be prepended to allow proper
# resolution of the app.php file and to redirect to the correct URI. It will
# work in environments without path prefix as well, providing a safe, one-size
# fits all solution. But as you do not need it in this case, you can comment
# the following 2 lines to eliminate the overhead.
RewriteCond %{REQUEST_URI}::$1 ^(.+/\.\*)\(.*\)::.2$
RewriteRule ^\(.*\) - [E=BASE: %1]

# Redirect to URI without front controller to prevent duplicate content
# (with and without `\front_controller.php`). Only do this redirect on the initial
# rewrite by Apache and not on subsequent cycles. Otherwise we would get an
# endless redirect loop (request -> rewrite to front controller ->
# redirect -> request -> ...).
# So in case you get a "too many redirects" error or you always get redirected
# to the start page because your Apache does not expose the REDIRECT_STATUS
# environment variable, you have 2 choices:
# - disable this feature by commenting the following 2 lines or
# - use Apache >= 2.3.9 and replace all L flags by END flags and remove the
#   following RewriteCond (best solution)
RewriteCond %{ENV:REDIRECT_STATUS} ^$
RewriteRule ^\front_controller\..php/(\.*)\$ %{ENV:BASE}$/2 [R=301,L]

# If the requested filename exists, simply serve it.
# We only want to let Apache serve files and not directories.
RewriteCond %{REQUEST_FILENAME} !-f
RewriteRule . - [L]

# Rewrite all other copies to the front controller
Rewrite all other queries to the front controller.

```
RewriteRule ^(.*)$ %ENV:BASE%/front_controller.php [L,QSA]
```
