```

```
# #####
```

```
# -----
```

```
# | Clickjacking |
```

```
# -----
```

```
# Protect website against clickjacking.
```

```
# The example below sends the `X-Frame-Options` response header with the value  
# `DENY`, informing browsers not to display the web page content in any frame.
```

```
# This might not be the best setting for everyone. You should read about the  
# other two possible values for `X-Frame-Options`: `SAMEORIGIN` & `ALLOW-FROM`.  
# http://tools.ietf.org/html/rfc7034#section-2.1
```

```
# Keep in mind that while you could send the `X-Frame-Options` header for all  
# of your site's pages, this has the potential downside that it forbids even  
# non-malicious framing of your content (e.g.: when users visit your site using  
# a Google Image Search results page).
```

```
# Nonetheless, you should ensure that you send the `X-Frame-Options` header for  
# all pages that allow a user to make a state changing operation (e.g: pages
```

```
# that contain one-click purchase links, checkout or bank-transfer confirmation
# pages, pages that make permanent configuration changes, etc.).

# Sending the `X-Frame-Options` header can also protect your website against
# more than just clickjacking attacks: https://cure53.de/xfo-clickjacking.pdf.

# http://tools.ietf.org/html/rfc7034
# http://blogs.msdn.com/b/ieinternals/archive/2010/03/30/combating-clickjacking-with-x-

# | Content Security Policy (CSP) |
# -----

# Mitigate the risk of cross-site scripting and other content-injection attacks.

# This can be done by setting a `Content Security Policy` which whitelists
# trusted sources of content for your website.

# The example header below allows ONLY scripts that are loaded from the current
# site's origin (no inline scripts, no CDN, etc). This almost certainly won't
# work as-is for your site!

# For more details on how to craft a reasonable policy for your site, read:
# http://html5rocks.com/en/tutorials/security/content-security-policy (or the
# specification: http://w3.org/TR/CSP). Also, to make things easier, you can
# use an online CSP header generator such as: http://cspisawesome.com/.

# <IfModule mod_headers.c>

# -----  
# | Reflected Cross-Site Scripting (XSS) attacks |  
# -----  
  
# (1) Try to re-enable the Cross-Site Scripting (XSS) filter built into the  
# most recent web browsers.  
#  
# The filter is usually enabled by default, but in some cases it may be  
# disabled by the user. However, in Internet Explorer for example, it can  
# be re-enabled just by sending the `X-XSS-Protection` header with the  
# value of `1`.  
#  
# (2) Prevent web browsers from rendering the web page if a potential reflected  
# (a.k. a non-persistent) XSS attack is detected by the filter.  
#  
# By default, if the filter is enabled and browsers detect a reflected  
# XSS attack, they will attempt to block the attack by making the smallest  
# possible modifications to the returned web page.  
#  
# Unfortunately, in some browsers (e.g.: Internet Explorer), this default  
# behavior may allow the XSS filter to be exploited, thereby, it's better  
# to tell browsers to prevent the rendering of the page altogether, instead  
# of attempting to modify it.  
#  
# http://hackademix.net/2009/11/21/ies-xss-filter-creates-xss-vulnerabilities  
#  
# IMPORTANT: Do not rely on the XSS filter to prevent XSS attacks! Ensure that  
# you are taking all possible measures to prevent XSS attacks, the most obvious  
# being: validating and sanitizing your site's inputs.  
#  
# http://blogs.msdn.com/b/ie/archive/2008/07/02/ie8-security-part-iv-the-xss-filter.aspx

# | Filename-based cache busting |
# -----

# If you're not using a build process to manage your filename version revving,
# you might want to consider enabling the following directives to route all
# requests such as /css/style.12345.css to /css/style.css.

# To understand why this is important and a better idea than *.css?v231, read:
# http://stevesouders.com/blog/2008/08/23/revving-filenames-dont-use-querystring

# <IfModule mod_rewrite.c>
#     RewriteCond %{REQUEST_FILENAME} !-f
#     RewriteRule ^(.+)\.(\d+)\. (js|css|png|jpe?g|gif)$ $1. $3 [L]
# </IfModule>

# -----

```

```
# | File concatenation |
# -----|

# Allow concatenation from within specific style sheets and JavaScript files.

# e.g.:
#
# If you have the following content in a file
#
#     <!--#include file="libs/jquery.js" -->
#     <!--#include file="plugins/jquery.timer.js" -->
#
# Apache will replace it with the content from the specified files.

# <IfModule mod_include.c>
#   <FilesMatch "\.combined\.js$" >
#     Options +Includes
#     AddOutputFilterByType INCLUDES application/javascript application/json
#     SetOutputFilter INCLUDES
#   </FilesMatch>
#   <FilesMatch "\.combined\.css$" >
#     Options +Includes
#     AddOutputFilterByType INCLUDES text/css
#     SetOutputFilter INCLUDES
#   </FilesMatch>
# </IfModule>
```
