#   OUR IND CHT""
# </IfModule>

# ###############################################################################################
# Start rewrite engine
# ###############################################################################################

# Turning on the rewrite engine is necessary for the following rules and
# features. FollowSymLinks must be enabled for this to work.

# Some cloud hosting services require RewriteBase to be set: goo.gl/4OoPN
# If using the h5bp in a subdirectory, use `RewriteBase '/foo' instead where
# 'foo' is your directory.

# If your web host doesn't allow the FollowSymLinks option, you may need to
# comment it out and use `Options +SymLinksIfOwnerMatch`, but be aware of the
# performance impact: http://goo.gl/M1uzd

<IfModule mod_rewrite.c>
   Options +FollowSymLinks
# Options +SymLinksIfOwnerMatch
# RewriteEngine On
# RewriteBase /
</IfModule>

# ###############################################################################################
# Suppress or force the "www." at the beginning of URLs
# ###############################################################################################

# The same content should never be available under two different URLs -
# especially not with and without "www." at the beginning, since this can cause
# 403 problems (duplicate content). That's why you should choose one of the
# Old problems (duplicate content). That's why you should choose one of the
# alternatives and redirect the other one.

# By default option 1 (no "www.") is activated.
# no-www.org/faq.php?q=class_b

# If you'd prefer to use option 2, just comment out all option 1 lines
# and uncomment option 2.

# IMPORTANT: NEVER USE BOTH RULES AT THE SAME TIME!

# Option 1:
# Rewrite "www.example.com -> example.com".

<IfModule mod_rewrite.c>
   RewriteCond %{HTTPS} !=on
   RewriteCond %{HTTP_HOST} ^www\.(.+)$ [NC]
   RewriteRule ^ http://\1%{REQUEST_URI} [R=301,L]
</IfModule>

# Option 2:
# Rewrite "example.com -> www.example.com".
# Be aware that the following rule might not be a good idea if you use "real"
# subdomains for certain parts of your website.

<IfModule mod_rewrite.c>
   # RewriteCond %{HTTPS} !=on
   # RewriteCond %{HTTP_HOST} !^www\.(.+)$ [NC]
   # RewriteRule ^ http://www. %{HTTP_HOST}%{REQUEST_URI} [R=301,L]
</IfModule>

# Built-in filename-based cache busting

# If you're not using the build script to manage your filename version revving,
# you might want to consider enabling this, which will route requests for
# "style.css.20110832.css" to "style.css.20110833.css".
To understand why this is important and a better idea than all.css?v1231, please refer to the bundled documentation about `.htaccess`.

```
# <IfModule mod_rewrite.c>
#    RewriteCond %{REQUEST_FILENAME} !-f
#    RewriteCond %{REQUEST_FILENAME} !-d
#    RewriteRule ^(.+)\.\(\d+\)\.\(j\|ss|png|jpg|gif\)$ $1.$3 [L]
# </IfModule>

# Prevent SSL cert warnings
# -----------------------------------------------

# Rewrite secure requests properly to prevent SSL cert warnings, e.g. prevent
# https://www.example.com when your cert only allows https://secure.example.com

# <IfModule mod_rewrite.c>
#    RewriteCond %{SERVER_PORT} !^443
#    RewriteRule ^https://example-domain-please-change-me.com%{REQUEST_URI} [R=301,L]
# </IfModule>

# Prevent 404 errors for non-existing redirected folders
# -----------------------------------------------

# without -MultiViews, Apache will give a 404 for a rewrite if a folder of the
# same name does not exist.
# webmasterworld.com/apache/3808792.htm

Options -MultiViews

# Custom 404 page
# -----------------------------------------------

# You can add custom pages to handle 500 or 403 pretty easily, if you like.
# If you are hosting your site in subdirectory, adjust this accordingly
# e.g. ErrorDocument 404 /subdir/404.html
ErrorDocument 404 /404.html
# UTF-8 encoding
# -----------------------------------------------

# Use UTF-8 encoding for anything served text/plain or text/html
AddDefaultCharset utf-8

# Force UTF-8 for a number of file formats
AddCharset utf-8 .atom .css .js .json .rss .vtt .xml

# -----------------------------------------------
# A little more security
# -----------------------------------------------

# To avoid displaying the exact version number of Apache being used, add the
# following to httpd.conf (it will not work in .htaccess):
# ServerTokens Prod

# "-Indexes" will have Apache block users from browsing folders without a
# default document Usually you should leave this activated, because you
# shouldn't allow everybody to surf through every folder on your server (which
# includes rather private places like CMS system folders).
<IfModule mod_autoindex.c>
